

Construction of underground optical cable pipelines

Overview

This guide walks through each stage of underground fiber installation—from route planning and conduit selection to splicing, termination, and testing—to help ensure long-term network performance and reliability. Underground cables are pulled in conduit that is buried underground, usually 1-1.2 meters (3-4 feet) deep to reduce the likelihood of accidentally being dug up. In extreme cold climates, cables may need to be buried at greater depths where temperatures are colder and frost penetrates to. Installing fiber optic cables underground involves far more than digging trenches and placing cables. Restricted by construction. Underground construction is one of the most important processes in fiber optic cable plant construction. This section will cover the basics of these processes and cover the requirements and the details the construction manager and workers need to know.
