

Copper is commonly used in distribution boxes

Overview

Bus bars are metal strips or bars, typically made of aluminum or copper, used to conduct electricity within switchboards, substations, and distribution panels. These conductors are used for distributing power in electrical systems, minimizing energy loss, and ensuring. Copper and aluminum busbars look similar, but their real-world performance in switchgear, load centers, and electrical distribution boards is completely different. This article breaks down the technical differences, risks of copper-clad aluminum, and why E-abel uses only certified. Distribution boxes are the nervous system of any electrical installation, silently managing the flow of power to every corner of your building. The choice between copper and aluminum components isn't just about cost - it's a critical safety decision. In simple terms, it serves as a central point for multiple electrical connections where incoming and outgoing currents exchange.
