An optical module high and low temperature test device, comprising: the TEC driver, the test box and the cooling box; wherein: the TEC driver is connected with the test box and used for driving the TEC refrigerator in the test box to realize the heating and refrigerating functions. Die Tester CT8203 is for the LIV scanning and optoelectronic characteristics test of the semiconductor LD laser at low temperature and normal temperature. The system is designed with a dual temperature zone to test two DUTs under different temperatures in parallel. The system is mainly composed of. From a connector and fiber-optic engineer's perspective, this article breaks down Fixture design (ICT/FCT) for data center optical-module PCB testing. We explain how to balance high-speed signal integrity, precision thermal management, materials science, and system-level airflow—and how fixtures. Optical modules are core components in optical communication networks. As data centers evolve toward 400G/800G and 5G front-haul and CPO (co-packaged optics) advance rapidly. The Multi Application Test System (MATS) is an integrated platform for high-precision, high-throughput testing of optical devices, transceivers, and photonic components. It realizes the conversion between optical signals and electrical signals, allowing data to be transmitted through optical fibers at higher speeds and longer distances. · There is a relatively airtight test chamber, which provides a good environment for the heat flow meter to quickly heat and cool the product.
