

Secondary or tertiary power distribution box

Overview

Primary: The main distribution panel, supplies power from the transformer. Let's make an example for clarity: A newly constructed residential area introduces a 10kV power line to a substation. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. Distribution substations connect to the transmission system and lower the transmission voltage to medium voltage ranging between 2 kV and 33 kV. The construction power distribution cabinet is designed specifically for the special situation of the construction site and complies with the relevant construction electricity specifications and standards of the construction department. The complete set of products can form a complete three-level. Secondary distribution boxes, also known as sub-distribution boxes, generally serve specific power supply areas. After stepping down the voltage through the transformer's low-voltage side (0.
