

The tubular busbar structure adopts a single tube

Overview

A PTFE tubular busbar is a high-voltage power transmission device that uses a metal tube (typically copper or aluminum) as the conductor, PTFE-oriented film as the primary insulating medium, and a precision mechanical winding process to build a multi-layer shielding structure. The purpose of this document is to detail the requirements of Northern Powergrid in relation to the tubular busbar systems and associated fittings detailed within this document. This document supersedes the following documents, all copies of which should be destroyed. The electric busbar, as a centralised node, also links several incoming and outgoing circuits and. Solid busbars consist of a single, continuous conductor made from a material such as copper or aluminum. They are often used in low-to-medium current applications (e., <1000 A) where the heat generated is manageable. As the diagram clearly shows, if you divide a rigid busbar into 10 layers with the same cross-section, the flexibility increases by 99%.
