

# What are the circuit boards for a 400g optical module

## Overview

The functional components can be divided into a DSP chip, optical transmitter unit, optical receiver unit, monitoring unit, PCB circuit board, and housing. A ten-layer printed circuit board (10-layer PCB) is a type of multilayer PCB made by alternately laminating ten layers of conductive copper foil and insulating materials. 10-layer PCBs can effectively improve signal integrity and electromagnetic compatibility (EMC), reducing crosstalk and noise. This guide explains the key PCB technologies, materials, manufacturing processes, and cost considerations for 400G and 800G optical modules in 2026. What Are 400G and 800G Optical Modules?

2. With a transmission rate of up to 400 Gbps, 400G transceivers offer double the capacity of their predecessor (200G transceivers). In 400G optical modules, the DSP (Digital Signal Processor) is primarily. Unlike conventional PCBs, those designed for optical modules operate at the intersection of extreme electrical performance, stringent thermal constraints, and microscopic mechanical tolerances.
