Overview

A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. The optical fiber elements are typically individually coated with plastic layers and contained in a protective tube. Unlike copper wires, which are limited by lower data transmission speeds, shorter transmission distances, and higher susceptibility to electromagnetic interference, fiber optic cables offer unparalleled performance and can cover much greater distances without bumping up against signal degradation. A fiber optic cable is a thin strand of glass or plastic that transmits data as pulses of light instead of electrical signals. It is reliable, versatile, and widely used in many applications and industries. In. Nothing has changed the world of communications as much as the development and implementation of optical fiber. This article provides the basic principles needed to work with this technology. Most are roughly the diameter of a human hair, and. fiber optics, the science of transmitting data, voice, and images by the passage of light through thin, transparent fibers.
