

What is the rack that is placed in the optical distribution box

Overview

An Optical Distribution Frame is a rack or cabinet used to organize, protect, and manage fiber-optic cables. Holds fiber adapters and connectors (LC, SC, ST, etc. Each module has a front panel that is 19 inches (482. Its primary function is to provide a structured and accessible platform for connecting, managing, and distributing incoming and outgoing fiber optic lines in telecommunications. To realize the connection of fiber optic cable, we often need to use ODF (optical distribution frame), fiber optic termination box (rack mount fiber optic patch panel, fiber outlet), fiber distribution box for fiber management in the fiber optic link. However, many friends always feel confusing. When the fixed-function optical cable enters the rack, its outer sheath and strengthening core should be mechanically fixed, ground wire protection components should be installed, end protection treatment should be carried out, and the optical fibers should be grouped and protected.

OverviewOverview and historyEquipment mountingCoolingSpecificationsRelated standardsGallery

A 19-inch rack is a standardized frame or enclosure for mounting multiple electronic equipment modules. Each module has a front panel that is 19 inches (482.6 mm) wide. The 19 inch dimension includes the edges or ears that protrude from each side of the equipment, allowing the module to be fastened to the rack frame with screws or bolts. Common uses include computer servers, telecommunications equipment and networking hardware
