

Which port should the switch access cable be connected to

Overview

Enterprise LANs use the RJ45 port on 100/1000BASE switches. It connects access layer devices and uplinks from desktop switches or directly to end devices. It's common to use port 1 to connect to the router providing Internet access, and the other ports for devices. Modern switches, both low-end and high-end, are generally built out of one or more switching modules. Each switching module typically has full, non-blocking connectivity between all of its. Network cables from end devices, such as PCs and printers, should be connected to the switch ports. Give the switch an IP address so that you can administer it. The switch's command-line. Console connection—This is a direct local management connection that you use to initially configure the switch. Management connection—After you complete the initial. Each port on a network switch represents a unique pathway through which data can flow, allowing for simultaneous and independent communication between connected devices. RJ45 ports remain essential for.
