

Which type of switch with 4 optical ports is generally used

Overview

A 4-port Gigabit Ethernet Switch with SFP (Small Form-factor Pluggable) slots is a versatile and scalable solution that can cater to high-speed data transfer requirements as well as low latency and increased bandwidth needs. Enterprise LANs use the RJ45 port on 100/1000BASE switches. It connects access layer devices and uplinks from desktop switches or directly to end devices. RJ45 ports serve access-layer copper connections; SFP/SFP+ ports enable flexible 1G/10G uplinks; SFP28 delivers 25G for modern data centers; QSFP+ and QSFP28 support high-density 40G/100G spine-leaf. Ethernet switches serve as the central point in a network, enabling communication between connected devices such as computers, printers, and servers. Switches come in. Switches with Optical Fiber ports are usually equipped with a combination of RJ45 ports plus extra fiber optic ports for connecting to fiber cables. The fiber optic ports are called SFP ports (Small-Form Factor Pluggable). SFP replaces the formerly common gigabit interfaz converter (GBIC), and SFP is also called Mini-GBIC.
